

Change Control and Sign-Off

Foundation endorsement — Vision and Strategy

[Vision and Strategy](#) endorsement is an upstream lifecycle decision. It confirms product direction for continued requirements work but does not approve the BRD baseline, authorise Jira creation, accept UAT, or authorise release.

Role	Decision	Name	Date	Conditions/comments
Executive Sponsor	Pending			Pending stakeholder validation
Product Owner	Pending			Coordinates validation and recommendation

Role governance is recorded in the [Stakeholder Register and RACI](#).

Lifecycle gates

1. Gate 1 — Requirements Baseline Approval: Approves the BRD scope, requirements, priorities and controlled assumptions. Authorises Jira backlog creation and implementation planning.
2. Gate 2 — UAT Acceptance: Occurs after implementation and test execution. Records scenario results, defects, deviations and business acceptance.
3. Gate 3 — Pre-Production Release Approval: Requires accepted UAT results plus applicable security, compliance, data, operational and release-readiness evidence.
4. Authoritative records: Change Control and Sign-Off is the authoritative location for the requirements-baseline approval record and the pre-production release-approval record.
5. UAT evidence: Detailed UAT results and UAT acceptance evidence remain on the UAT Plan and Scenarios page: [UAT Plan and Scenarios](#)
6. UAT summary: This page contains only a linked summary of UAT status. UAT acceptance is not requirements-baseline approval or release approval.

Change request contents

Every post-baseline change shall record:

- Change ID, date, requestor, and owner.
- Affected requirement IDs/pages.
- Current and proposed wording/priority/status.
- Business value and reason.
- Scope, schedule, cost, data, security, compliance, architecture, test, UAT, and operational impact.
- Dependencies and migration/rollback needs.
- Decision, approvers, date, and implementation evidence.

Decision thresholds

- Product Owner may approve clarification with no scope/priority/control impact.
- Scope, Must/Should priority, safety, privacy, residency, or release-gate changes require the relevant accountable business and control owners.
- Any reduction of grounding, RBAC, deterministic compliance, auditability, or human approval requires explicit executive, product, compliance, and security approval; no prompt-only workaround is acceptable.
- Deferred autonomous or production-write capability requires a new approved scope/design package.

Baseline register

Baseline	Version	Status	Date	Notes
BRD + MoSCoW Pass #1	v0.2	Draft — not approved	20 Aug 2026	Evidence-corrected publication candidate
Supporting BA artefacts	v0.2	Draft — not approved	20 Aug 2026	Assumptions explicitly marked
Jira backlog	Not created	Blocked by baseline gate		Create only after approval
Vision and Strategy	v0.1	Draft — pending		Not endorsed; does not

		stakeholder validation		approve the BRD baseline
Glossary and Data Dictionary	v0.1	Draft/pre-baseline — not approved		Proposed definitions and classifications; DD-01–DD-14 remain open

Definition change handling

Before Gate 1, glossary and data-dictionary corrections remain controlled draft updates and must be reflected in page history, RAID and affected traceability. After Gate 1, any semantic change affecting approved scope, requirements, controls, interfaces, metrics or acceptance criteria requires a formal change request. Pure editorial corrections with no semantic or control impact may follow the existing clarification threshold.

Gate 1 — Requirements Baseline Approval Record

Role	Decision	Name	Date	Conditions / comments
Executive Sponsor	Pending			
Product Owner	Pending			
Provider RCM/AR Operations Owner	Pending			
TPA Operations Lead	Pending			
Compliance and	Pending			

Regulatory Owner				
Information Security/Privacy Owner	Pending			
Data Owner	Pending			
UAT Lead	Pending			

Gate 3 — Pre-Production Release Approval Record: Pending. Approver names, dates and decisions remain blank until the release gate. This page is authoritative for both Gate 1 and Gate 3 approval records. Blank name/date fields are not approvals. A Confluence view, comment, or page publication is not sign-off unless the decision is explicitly recorded.
